UCF | Materials Science and Engineering

UNIVERSITY OF CENTRAL FLORIDA

MATERIALS SCIENCE & ENGINEERING DISTINGUISHED SEMINAR SERIES

Dr. Nicholas A. Kotov

Irving Langmuir Distinguished University Professor

Department of Chemical Engineering

University of Michigan
Ann Arbor

Friday
March 4, 2022

11:00AM — 12:00PM
HEC 101

Zoom

Contact: Dr. Tengfei Jiang

Materials Science & Engineering

Phone: 407-823-2284

Email: Tengfei.Jiang@ucf.edu

Presented in partnership with
The College of Graduate Studies

Chirality and Complexity of Engineered Nanostructures

The structural and functional complexity of biomimetic materials arises from the spontaneous hierarchical ordering of inorganic building blocks over multiple scales. Empirical observations of complex nanoassemblies are abundant, but physicochemical mechanisms leading to their geometrical complexity remain puzzling, especially for non-uniformly sized components. These mechanisms are discussed in this talk taking an example of hierarchically organized particles with twisted spikes and other morphologies from polydisperse Au-Cys nanoplatelets [1]. The complexity of these supraparticles is higher than biological counterparts or other complex particles as enumerated by graph theory (GT). Complexity Index (CI) and other GT parameters are applied to a variety of different nanoscale materials to assess their structural organization. As the result of this analysis, we determined that intricate organization Au-Cys supraparticles emerges from competing chirality-dependent assembly restrictions that render assembly pathways primarily dependent on nanoparticle symmetry rather than size. These findings open a pathway to a large family of colloids with complex architectures and unusual chiroptical and chemical properties. The design principles elaborated for nanoplatelets have been extended to engineering of other complex nanoassemblies. They include polarization-based drug discovery platforms for Alzheimer syndrome,[3] materials for chiral photonics,[5] biomimetic composites for energy and robotics [2,4], CO2-dispersable catalysis[6] and chiral antiviral vaccines.[7] Yet, the work on the generalization of the engineering principles for chiral biomimetic nanostructures is incomplete; further directions of these efforts will be discussed.

Biography: Nicholas A. Kotov have graduate and undergraduate degrees in Chemistry and Chemical Engineering for studies on bioinspired harvesting of solar energy. His postdoctoral work encompassed the synthesis and self-assembly of biomimetic nanocomposites. After taking an Assistant Professor position at Oklahoma State University, he expanded the field of biomimetic processes and materials by establishing a vigorous research program on self-assembly of nanostructures. Nicholas is currently Irving Langmuir Distinguished University Professor of Chemical Sciences and Engineering at the University of Michigan. He heads the laboratory and international team of scientists working on practical implementations and theoretical foundations of biomimetic nanostructures. Self-assembly and optical properties of chiral nanoparticles and their superstructures represent a focal point for the continuum of bioinspired nanoscale materials with multidisciplinary significance to physics, chemistry, biology, and medicine. Nicholas is a co-founder of five startups and a passionate advocate for scientists with disabilities.
